RESPONSE TO THE EXAMINER'S OFFICE ACTION

In reply to the Office Action dated October 2, 2002, designated as Paper No. 4 in the above-captioned application, please enter the following amendments and Remarks as follows:

In the Specification

Please replace the paragraph beginning at page 5, Line 19, with the following rewritten paragraph:

A<sup>1</sup>  
In this third embodiment, the burner manifold is formed by an extrusion process. The burner manifold tapers from a first end to a second end or, alternatively, has a tapered section located between the first end and the second end. This can be done, for example, by plastically transforming a preform of parallel channels (honeycomb substrate) into a funnel of funneling channels. Two suitable transforming processes are hot draw down and reduction extrusion. "Hot draw down" is a viscous forming process carried out on viscously sintered preforms and is described in commonly-owned U.S. Patent Application No. 09/299,766 entitled "Redrawn Capillary Imaging Reservoir", the specification of which is hereby incorporated herein by reference. "Reduction extrusion" is a plastic forming process carried out on unsintered particulate preforms as illustrated in Corning's U.S. Patent No. 6,299,958
